The optimal use of telehealth to deliver safe patient care

Issue:
The use of telehealth during the COVID-19 pandemic has skyrocketed, enabling the timely delivery and continuity of safe patient care while preventing exposure to the coronavirus. Continuity of care is especially important for patients with chronic disease, the elderly, and behavioral health care patients who require routine check-ins with their providers. Additional benefits of telehealth — also called virtual health services — include:

• Promoting social distancing.
• Aiding in monitoring the progression of home-quarantined COVID-19 patients.
• Enabling providers who are quarantined but asymptomatic to provide care remotely from their homes, thus mitigating the loss of highly needed resources.
• Reducing the use of personal protective equipment (PPE).
• Helping patients with transportation barriers connect with their care providers.

Inpatient settings can use telehealth at the patient’s bedside to conduct remote monitoring as well as remote consultation, either among doctors within the organization or from different regions, to diagnose and treat patients.

The widespread use of telehealth was enabled by the Centers for Medicare & Medicaid Services (CMS) in April 2020 when it issued 1135 COVID-19 emergency declaration blanket waivers for health care providers. The waivers, which have a retroactive date of March 1, 2020, are effective through the end of the emergency declaration.

Like other health systems, Kaiser Permanente saw the use of telehealth versus in-person visits flip compared to pre-pandemic days. The organization averaged 85% in-person office visits and 15% telehealth appointments prior to the COVID-19 outbreak, versus an average of 20% office visits and 80% telehealth appointments as of May. Kaiser is ahead of the curve on telehealth implementation and use compared to other providers and systems; it has offered telehealth services to its members in various forms since the late 1990s, established criteria for virtual visits by phone and video, and identified telehealth-appropriate medical conditions.

Telehealth barriers and challenges
While telehealth has many benefits, there also are usage barriers and challenges in implementation. Some of the challenges include patient populations who are not technologically capable; limited access to technological devices or connectivity issues; and problems monitoring the quality and safety of telehealth. An additional limitation is that not all conditions can be appropriately or safely managed via telehealth.

Additional barriers include inconsistent reimbursement models; legal and regulatory issues; and questions about security, privacy, and confidentiality, including Health Insurance Portability and Accountability Act (HIPAA) concerns.

Safety actions to consider:
There are some strategies that providers and health care organizations can take to optimize the use of telehealth to deliver safe care and effective care to patients during the public health emergency.

Set up your telehealth system for success:
• Establish key metrics for success. Hard metrics can include number of patients seen via telehealth, reductions in no-shows, and clinical outcomes. It’s also important to set qualitative metrics, such as how telehealth has impacted patient and staff satisfaction, and compliance with treatment as a result of access, convenience, and continuity of care. The data can be used to look for opportunities to restructure the program for improvement.
• Ensure that your vendor can give you easy access to data needed to support your key success metrics.
• Ask about ways your vendor can provide support pre- and post-implementation, for example, training, tech support, workflow design collaboration, data analysis, cybersecurity, and project management.4
• Ensure that your organization has a secure platform that supports HIPAA concerns (i.e., your organization has a Business Associate Agreement with the platform).9

**Consider how your clinical services can most effectively be used via telehealth:**
• Develop protocols for virtual care. Reduce variation between specialties and service lines by training providers to provide a standardized high-quality care experience for patients.10
• Determine standards for which symptoms and conditions can be managed virtually. Use these standards to triage patients who request a virtual visit.10
• **Be aware of regulations around scope of practice:** limitations regarding different health care disciplines can vary by state.10
• Each physician should determine the need for vital signs and the safest and most appropriate approach to accurately obtain them. Some home monitoring programs incorporate measurement and recording of various vital signs. Where vital signs are important for evaluation and management, an in-person examination may be preferred.11
• When relying on remote consultations for inpatient care, mandate that another clinician should be at the patient’s bedside to assist during the session.10

**Follow-through on the details to make telehealth work efficiently with your workflow:**
• Train staff on the telehealth workflow, define roles and responsibilities for both patients and staff, and explain new processes or procedures.4 One academic medical center created a series of live educational support and online educational modules.12
• Integrate staff feedback into the scheduling process.4
• Identify a staff superuser who can provide support and training.4

**Use data and other feedback on your telehealth experiences to make improvements:**
• Give clinicians real-time access to patient data.10
• Enable the collection of remote patient monitoring data into the electronic health record, particularly temperature and pulse oximetry data, blood pressure and glucose.2
• Build on your telehealth success to improve management of other patient populations, conditions and specialties.4

Many medical professional associations provide specific telehealth/telemedicine guidance on their medical specialty for their members. Some of these are listed in the Resources section below. Also, the American Telemedicine Association (ATA) has a [Telehealth Resource Center](https://www.amta.org/Telehealth-Resources/) that provides a comprehensive collection of guidelines.
